Daily Scholar Papers Report — 2026-05-07

[Download PDF](#)

Window covered: 2026-05-06 → 2026-05-07 (Google Scholar alerts + user-curated self-emails, last 24 h)

Executive Summary

An **empty alert window**. No new Scholar-alert threads landed in the last 24 hours, and no user-curated self-emails were forwarded for review either. The most recent Scholar batch resolves to 2026-05-06 00:36 UTC — six threads already fully absorbed into the 2026-05-06 report (DirtyFree, REBench, NvRec, Crypto-Rust, plus two off-topic skips). The most recent user-curated self-email is from 2026-05-05 (also already absorbed). A broader fallback query (`after:2026/05/06`) was run on both inboxes to rule out a syntax glitch; both confirmed zero net-new threads in the 24 h window.

No Stage-1 screening or Stage-2 deep-reads were performed today. Preference posteriors were still refreshed (19 active attribute Beta-posteriors in `.private/preferences.json`) so tomorrow's run starts from the latest belief state.

Outstanding: 0 · **Keep:** 0 · **Borderline High-Priority:** 0

Highlighted Papers

No papers in window.

Cross-Paper Synthesis

Not applicable for an empty window. The standing themes from this week remain open: (i) **kernel-exploit primitive simplification** (DirtyFree's single-arbitrary-free framing, 2026-05-06) versus the rest of the cross-cache exploit literature, and (ii) **fair-by-construction LLM-on-binary benchmarks** (REBench, 2026-05-06) versus the persistent cross-paper irreproducibility problem (the SymGen / AsmDepictor 0.05 → 0.351 → 0.715 spread). Tomorrow's batch is expected to bring the Thursday / Friday Scholar digest; if not, the next report will note a continued gap.

Writing & Rationale Insights

No new prose to mine today. A meta-observation worth recording: across the last nine reports, the day-after-a-Tuesday-batch window has produced zero papers four out of nine times. The expected daily yield of ~1.5 papers is heavily weighted toward Tue + Fri Scholar digests; an empty Wednesday or Thursday should not be treated as a pipeline bug. The infrastructure — preferences refresh, Gmail query, git pull, deploy-key push, mkdocs strict build, weasyprint render — was exercised end-to-end on this empty run and passed without incident, which is the secondary value of running the pipeline on quiet days.
