Daily Scholar Papers Report — 2026-07-29

[Download PDF](#)

Window covered: 2026-07-28 → 2026-07-29 (Google Scholar alerts + user-curated self-emails, last 24 h)

Executive Summary

No new candidates arrived in today's 24-hour window. Both intake channels — Google Scholar alerts and the user-curated self-email queue — returned zero threads at run time, and each was re-queried in an absolute-date form to confirm the gap is real rather than an artefact of Gmail's rolling window. This is a quiet-day report: no papers were screened at Stage-1 and none were deep-read.

There is no un-covered backlog behind this silence. The most recent Scholar batch landed on 2026-07-27 and was triaged in full by the previous run, whose window abuts today's; the two self-curated papers still visible in a wider search date to the same morning and were deep-read in the 2026-07-27 digest. Carry-over from earlier days is not folded in, per the pipeline's rolling-window policy.

Outstanding: 0 · **Keep:** 0 · **Borderline High-Priority:** 0

Writing & Rationale Insights

Not applicable — empty window. The pipeline itself ran cleanly: preference posteriors were refreshed (19 attributes on file, no new feedback issues open), the repository was already in sync, and both intake queries executed against the Gmail connector without error. Worth noting for anyone reading the archive as a time series: this is the second quiet day this month, and the Scholar channel has been arriving in clusters separated by roughly one to three days of silence rather than on a daily cadence — so a zero-yield window is a property of the source, not a signal that the field has gone quiet.
