Daily Scholar Papers Report — 2026-06-12

[Download PDF](#)

Window covered: 2026-06-11 → 2026-06-12 (Google Scholar alerts + user-curated self-emails, last 24 h)

Executive Summary

Zero-volume day. No new Google Scholar alert email arrived in the 24 h window, and no self-curated paper email was forwarded either. The four candidates that *are* in the inbox (the Princeton *WEBGRAPHMIX* preprint from Danqi Chen's group, UCL/BynarIO/Columbia *Veritas*, UCLouvain *PROSE+MUSE*, and the *RULEDROID* IEEE Transactions piece) all came in on 2026-06-11 and were fully analysed in [yesterday's report](#); re-processing them today would only duplicate that work. Today's digest is therefore intentionally empty — pipeline ran end-to-end, no deep reads were warranted.

Outstanding: 0 · **Keep:** 0 · **Borderline High-Priority:** 0

Highlighted Papers

No new papers in this window.

Cross-Paper Synthesis

Nothing to synthesise today. For thematic continuity, [yesterday's synthesis](#) (binary BMCV detection ↔ LM data selection ↔ network-protocol fuzzing) still represents the most recent active threads.

Writing & Rationale Insights

A zero-volume day is itself a small data point about Scholar's alert cadence — recommendation digests are not strictly daily, and a quiet day is the expected long-tail behaviour rather than a pipeline failure. Logging the zero-day explicitly (rather than silently skipping) keeps the report index honest and makes it easier to spot a *real* outage if the inbox stays empty for several days in a row.
